**Supplementary Table 1** Quantification of the efficiency of initiation of viral replication of the original and modified GFP-expressing viral vectors. For each construct, GFP fluorescence was determined for 3 separate infiltrations (a-c). Fluorescence values were multiplied by 0.7 in order to be visualized at the same scale as protoplast counts. The percentage of protoplasts expressing GFP was counted twice (d and e) for each construct. SD, standard variation.
protoplasts expressing GfP was counted twice (d and e) for each construct. SD, standard variation.
